### 4.1. THE pH :

"**pH** is the negative logarithm of the  $H^+$  ion concentration in a solution."

**Mathematically**,  $pH = -\log[H^+]$

OR

"pH is **logarithm (base 10)** of the reciprocal of hydrogen ion concentration."

**Mathematically :**

$$pH = \log \frac{1}{[H]^+}$$

$$pH = \log \frac{1}{[H_3O]^+}$$

$$pH = -\log [H_3O]^+$$

**pOH:** "The concentration of hydroxide ions in a solution can be expressed in terms of pOH."

**Mathematically :**

$$pOH = -\log [OH]^-$$

#### Introduction of pH:

- Introduced in 1909 by Danish biochemist **S.P.L. Sorensen**.

- Symbol **pH**:

Letter **p** from German word *potenz* (meaning power or exponent of 10).

In Latin, "pH" is said to mean *pondus hydrogenii* (weight of hydrogen).

#### Historical context:

**1909:** Sørensen published a paper in Biochem Z discussing effect of  $H^+$  ions on enzyme activity.

- He coined the term pH and defined it as:

$$pH = -\log [H^+]$$

**1924:** Sørensen updated the definition, stating **pH is a function of the activity (effective concentration) of  $H^+$  ions, not just concentration.**

$$pH = -\log a\{H^+\}$$

where  $a\{H^+\}$  = activity of hydrogen ions.

## Relation between pOH and pH:

$$pK_w = pH + pOH$$

At 25°

$$pH + pOH = 14$$

**SOCH BADLO BY MAK**

Contact WhatsApp Number: +92 331 5014353

## 4.2. THE pH SCALE:

**Purpose:** Numerical scale showing acidic or alkaline strength of a solution.

**Range:** 0 to 14.

**Acids:**  $pH < 7$ .

**Bases/Alkalis:**  $pH > 7$ .

**Neutral:**  $pH = 7$ .

### Interpretation:

Lower pH → more acidic.

Higher pH → more alkaline.

### Example:

$pH\ 0 \rightarrow [H_3O^+] = 1\ M$ .

$pH\ 14 \rightarrow [OH^-] = 1\ M$ .

Typical range of  $[H^+]$  in solutions:

Between 1 M (pH 0) and  $10^{-14}$  M (pH 14).

### Example – 4.1:

Find the pH of a solution of 0.002M of HCl.

**Data:**  $[H^+] = 2 \times 10^{-3}\ M$

**Required:**  $pH = ?$

**Solution:** As we know,

$$pH = -\log [H^+]$$

$$pH = -\log (2 \times 10^{-3})$$

$$pH = 2.70$$

### Example – 4.2:

If moist soil has a pH of 7.84, what is the  $H^+$  concentration of the soil solution?

**Data :** pH = 7.84

**Required :**  $H^+$  concentration of soil solution =  $[H^+] = ?$

**Solution :** As we know

$$pH = -\log [H^+]$$

$$7.84 = -\log [H^+]$$

$$-7.84 \text{ (antilog)} = [H^+]$$

$$[H^+] = 1.45 \times 10^{-8}$$

### CONCEPT ASSESSMENT EXERCISE – 4.1

**Q1).** What is the pH of a solution of 2g pure  $H_3PO_4$  per  $dm^3$  of solution?

**Data :** Mass of  $H_3PO_4 = 2g$

Volume of solution =  $1 dm^3$

**Required :** pH = ?

**Solution :** Molar mass of  $H_3PO_4 = 3 + 31 + (16) 4$

Molar mass of  $H_3PO_4 = 98 g/mol$

Now, to find moles:

$$\text{Moles in solution} = \frac{\text{mass}}{\text{molar mass}}$$

$$\text{Moles in solution} = \frac{2}{98}$$

Moles in solution = 0.0204 mol

**Reaction :**  $H_3PO_4 \rightleftharpoons H^+ + H_2PO_4^-$

	Initial	change	equilibrium
$H_3PO_4$	0.0204	$-x$	$0.0204 - x$
$H^+$	0	$+x$	$x$
$H_2PO_4^-$	0	$+x$	$x$

$$K_a = \frac{[H^+][H_2PO_4^-]}{[H_3PO_4]}$$

$$K_a = \frac{x \cdot x}{0.0204 - x}$$

$$K_a = \frac{x^2}{0.0204}$$

∴ x is small compared to 0.0204

$$\therefore K_a = 7.5 \times 10^{-3}$$

$$7.5 \times 10^{-3} = \frac{x^2}{0.0204}$$

$$7.5 \times 10^{-3} (0.0204) = x^2$$

$$x^2 = 1.53 \times 10^{-4}$$

$$\sqrt{x^2} = \sqrt{1.53 \times 10^{-4}}$$

$$x = 0.0124$$

As we know,

$$pH = -\log [H^+]$$

$$pH = -\log (0.0124)$$

$$pH = 1.91$$

$$\text{Molarity} = 0.0204M$$

GET ADMISSION IN OUR ONLINE INSTITUTE

**SOCH BADLO BY MAK**

Contact WhatsApp Number: +92 331 5014353

**Q2). Calculate the concentration of hydrogen ion ( $H^+$ ) in a solution of sulphuric acid having pH of 1.5.**

**Solution).**  $pH = -\log [H^+]$

$$1.5 = -\log [H^+]$$

$$-1.5 \text{ (antilog)} = [H^+]$$

$$[H^+] = 0.031 \text{ mol dm}^{-3}$$

### 4.3 IONIC PRODUCT OF WATER AND CALCULATION OF pH AND pOH.

The product of the concentration of  $H^+$  and  $OH^-$  ions in pure water at room temperature (298 K) is:

$$K_w = [H^+][OH^-]$$

$$K_w = [H_3O^+][OH^-]$$

GET ADMISSION IN OUR ONLINE INSTITUTE

**SOCH BADLO BY MAK**

Contact WhatsApp Number: +92 331 5014353

- $K_w$  is the ionic product or dissociation constant of water.

**Unit of  $K_w$ :**  $\text{mol}^2 \text{dm}^{-6}$

- In pure water, the concentrations of  $H^+$  and  $OH^-$  ions  $= 1 \times 10^{-7}$
- Value of  $K_w$  at room temperature:  $1 \times 10^{-14}$
- $pK_w$  formula  $= pK_w = -\log K_w$

$$pK_w = -\log (1 \times 10^{-14})$$

$$pK_w = 14$$

**Relation of  $K_w$  with  $pK_a$  and  $pK_b$  :**

$$pK_a + pK_b = pK_w = 14 \text{ (at 298K)}$$

**Relation of pH and pOH:**

$$pH + pOH = pK_w = 14 \text{ (at 298 K)}$$

- If the  $pK_a$  value of an acid is known, the  $pK_b$  value of its conjugate base can be found.

#### Example – 4.3

**If the concentration of NaOH in a solution is  $2.5 \times 10^{-4} \text{ M}$ , what is the concentration of  $H_3O^+$  ions at  $25^\circ\text{C}$ ?**

**Data :** Concentration of NaOH =  $2.5 \times 10^{-4} \text{ M}$  at  $25^\circ\text{C}$

**Required :**  $[H_3O^+] = ?$

**Solution :** As we know ,

$$K_w = [H_3O^+][OH^-]$$

$$\frac{K_w}{[OH]} = [H_3O^+]$$

$$[\text{H}_3\text{O}^+] = \frac{1 \times 10^{-14}}{2.5 \times 10^{-4}}$$

$$[\text{H}_3\text{O}^+] = 4 \times 10^{-19} \text{ M}$$

#### **Example – 4.4**

**Calculate the pH value of 0.001 mol dm<sup>-3</sup> solution of NaOH at 25°C.**

**Data :**  $[\text{OH}^-] = 0.001 \text{ mol dm}^{-3}$

**Required :** pH = ?

**Solution :** As we know,

GET ADMISSION IN OUR ONLINE INSTITUTE

**SOCH BADLO BY MAK**

Contact WhatsApp Number: +92 331 5014353

$$K_w = [\text{H}_3\text{O}^+][\text{OH}^-]$$

$$\frac{K_w}{[\text{OH}^-]} = [\text{H}_3\text{O}^+]$$

$$[\text{H}_3\text{O}^+] = \frac{1 \times 10^{-14}}{1 \times 10^{-13}}$$

$$[\text{H}_3\text{O}^+] = 1 \times 10^{-11}$$

$$\text{pH} = -\log [\text{H}_3\text{O}^+]$$

$$\text{pH} = -\log (1 \times 10^{-11})$$

$$\text{pH} = 11$$

#### **Example – 4.5**

**Calculate the pH of 5 x 10<sup>-5</sup>M of solution of NaOH**

**Solution)** As we know,

$$\text{pOH} = -\log[\text{OH}^-]$$

$$\text{pOH} = -\log (5 \times 10^{-5})$$

$$\text{pOH} = 4.30$$

To find pH,

$$\text{pH} + \text{pOH} = 14$$

$$\text{pH} = 14 - \text{pOH}$$

$$\text{pH} = 14 - 4.30$$

$$\text{pH} = 9.70$$

### **CONCEPT ASSESSMENT EXERCISE – 4.2**

**Q1). The concentration of hydroxide ion in a given solution of slaked lime  $[\text{Ca}(\text{OH})_2]$  is 0.001M. Calculate the concentration of hydrogen ion in it.**

**Data :**  $[\text{OH}^-] = 0.001\text{M}$

**Required :**  $[\text{H}^+] = ?$

**Solution :** As we know,

$$K_w = [\text{OH}^-][\text{H}^+]$$

$$\frac{K_w}{[\text{OH}^-]} = [\text{H}^+]$$

$$[\text{H}^+] = \frac{1 \times 10^{-14}}{1 \times 10^{-3}}$$

$$[\text{H}^+] = 1 \times 10^{-11}$$

GET ADMISSION IN OUR ONLINE INSTITUTE

**SOCH BADLO BY MAK**

Contact WhatsApp Number: +92 331 5014353

**Q2). An aqueous solution contains  $2 \times 10^{-3}\text{M}$  of hydrogen ions  $[\text{H}^+]$ . Calculate pOH of this solution.**

**Data :**  $[\text{H}^+] = 2 \times 10^{-3}\text{M}$

**Required :**  $\text{pOH} = ?$

**Solution :** As we know,

$$\text{pH} = -\log [\text{H}^+]$$

$$\text{pH} = -\log (2 \times 10^{-3})$$

$$\text{pH} = 2.69$$

To find pOH :

$$\text{pH} + \text{pOH} = 14$$

$$2.69 + \text{pOH} = 14$$

$$\text{pOH} = 14 - 2.69 = \mathbf{11.31M}$$

## 4.4 pH TITRATION CURVES

- To find the concentration of an unknown solution, **titration** is used.

**Titration:** "Titration is a method where a solution of known concentration (titrant) is added from a burette into a solution of unknown concentration (analyte) in a conical flask."

**Titrant :** In burette, a known concentration called titrant.

**Analyte :** In conical flask unknown concentration called analyte.

**Indicator :** An indicator is used to show when the reaction is complete (endpoint).

**Endpoint :** The endpoint is when the number of moles of acid equals the moles of base this is the equivalence point.

**Equivalence point :** Mid point in the graph indicates that the amount of titrant is equal to the amount of analyte is called equivalence point.

**Neutralization point:** when OH ions react with H ions.

- There are different pH titration curves depending on the strength of the acids and bases used.

### a. Strong Acid and Strong Alkali pH Titration Curve :

**Analyte:** Hydrochloric acid (HCl),  $1.0 \text{ mol dm}^{-3}$

**Titrant:** Sodium hydroxide (NaOH),  $1.0 \text{ mol dm}^{-3}$

**Indicator :** Phenolphthalein (pH 8.3–10) or Bromothymol blue (pH 6.0–7.6).

Colour changes are sharp due to the steep vertical section of the curve.

#### **Titration Process:**

- Acid (HCl) is placed in a conical flask.
- Base (NaOH) is added from a burette in small volumes.
- Initially, solution has only  $\text{H}^+$  ions, so pH is low (1– 2).
- As NaOH is added,  $\text{OH}^-$  ions neutralize  $\text{H}^+$  ions, pH rises slowly.
- Near equivalence point, a small addition of NaOH causes a sharp rise in pH.

GET ADMISSION IN OUR ONLINE INSTITUTE  
**SOCH BADLO BY MAK**  
Contact WhatsApp Number: +92 331 5014353

### Reaction:

( $\text{H}^+$  from acid reacts with  $\text{OH}^-$  from base to form water)

### Equivalence Point:

- Volume:  $25 \text{ cm}^3$  of NaOH to neutralize  $25 \text{ cm}^3$  of HCl.
- pH at equivalence point: 7 (neutral, because strong acid + strong base).

### Exceeding Equivalence Point:

- Extra NaOH increases  $\text{OH}^-$  concentration.
- pH rises above 7 into alkaline range (13–14).

**pH titration curve of  $1 \text{ mol dm}^{-3}$  HCl ( $25 \text{ cm}^3$ ) with NaOH :**

GET ADMISSION IN OUR ONLINE INSTITUTE

**SOCH BADLO BY MAK**

Contact WhatsApp Number: +92 331 5014353

### pH titration curve of 1 mol dm<sup>-3</sup> NaOH (25 cm<sup>3</sup>) with HCl:

**pH Titration Curve:** HCl added to NaOH

**Shape:** Same as NaOH titrated with HCl, flipped.

**Initial pH:** High (13–14).

**Final pH:** Low (1).

**Equivalence point:** pH = 7.

GET ADMISSION IN OUR ONLINE INSTITUTE

**SOCH BADLO BY MAK**

Contact WhatsApp Number: +92 331 5014353

### b. Strong Acid and Weak Alkali pH Titration Curve

**Analyte:** Strong acid (HCl) in conical flask (unknown)

**Titrant:** Weak alkali (NH<sub>3</sub>) in burette (known)

**Indicator:** Methyl orange (changes from red → yellow around acidic pH)

**Titration process:**

- Initially there will be only H<sup>+</sup> ion present in conical flask, pH (1– 2) HCl
- As weak alkali is added, pH increases slightly because H<sup>+</sup> ions react with NH<sub>3</sub>
- pH change is gradual until near equivalence point

**Reaction:**

The change in pH is not that much until volume added reaches an equivalence point.

**Equivalence point:** pH 5.5 (acidic) because  $\text{NH}_4^+$  is a weak acid

**Exceeding Equivalence point:** pH rises above 7, but not as high as strong alkali because  $\text{NH}_3$  is weak.

**pH titration curve of 1 mol dm<sup>-3</sup> HCl (25 cm<sup>3</sup>) with  $\text{NH}_3$ :**

GET ADMISSION IN OUR ONLINE INSTITUTE

**SOCHBADLO BY MAK**

Contact WhatsApp Number: +92 331 5014353

pH titration curve of  $1 \text{ mol dm}^{-3} \text{ NH}_3$  ( $25 \text{ cm}^3$ ) with  $\text{HCl}$  :

GET ADMISSION IN OUR ONLINE INSTITUTE

**SOCH BADLO BY MAK**

Contact WhatsApp Number: +92 331 5014353

- Here, weak alkali is taken at conical flask, and strong acid at burette.
- pH titration curve for strong acid added to weak base has the same shape.
- Equivalence point will be 5.5 pH

### c. Weak acid and strong alkali pH titration curve:

**Analyte:** Weak acid ( $\text{CH}_3\text{COOH}$ ) in conical flask (unknown)

**Titrant:** Strong alkali ( $\text{NaOH}$ ) in burette (known)

**Indicator:** Phenolphthalein (colorless  $\rightarrow$  pink in basic range)

**Titration process:**

- Initial pH: 2-3 (weak acid in conical flask)
- As  $\text{NaOH}$  is added, pH rises slowly because  $\text{H}^+$  ions react with  $\text{OH}^-$  to form water
- Near equivalence point, pH increases steeply

**Reaction:**

**Equivalence point:** pH 9 (slightly basic) because  $\text{CH}_3\text{COO}^-$  is a relatively strong base

**Exceeding Equivalence point:** pH increases up to 13–14 (excess NaOH present)

**pH titration curve of a strong base added to weak acid :**

GET ADMISSION IN OUR ONLINE INSTITUTE

**SOCH BADLO BY MAK**

Contact WhatsApp Number: +92 331 5014353

**titration curve of a weak acid added to a strong base:**

- Here, weak acid is taken in burette and strong alkali is taken in conical flask.
- pH titration curve for a weak acid added to a strong alkali has the same shape.
- The equivalence point will be 9 pH.

#### d. Weak acid and weak alkali pH titration curve :

**Analyte:** Weak acid ( $\text{CH}_3\text{COOH}$ )

**Titrant:** Weak alkali ( $\text{NH}_3$ )

**Titration process:**

- Initial pH: 2–3 ( $\text{H}^+$  ions from weak acid present)
- As weak alkali is added, pH increases gradually
- No steep vertical section in the curve

**Reaction:**

**Equivalence point:** pH depends on strengths of acid and base; shown as a “point of inflexion,” not a sharp jump.

**Exceeding Equivalence point:** pH rises slowly; final pH < strong alkali range

Contact WhatsApp Number: +92 331 5014353

### CONCEPT ASSESSMENT EXERCISE – 4.3

Q1). In a titration it is found that 25cm<sup>3</sup> of 0.1M solution of NaOH is neutralized with 19 cm<sup>3</sup> of HCl of unknown concentration, calculate concentration of given HCl solution:

**Data :**

$$M_1 = 0.1\text{M (NaOH)}$$

$$V_1 = 25 \text{ cm}^3 \text{ (NaOH)}$$

$$V_2 = 19 \text{ cm}^3 \text{ (HCl)}$$

**Required :** Concentration of HCl =  $M_2 = ?$

**Solution :** According to formula:

$$M_1V_1 = M_2V_2 \quad (\text{for 1:1 reaction})$$

$$(0.1)(25) = M_2 (19)$$

$$2.5 = M_2 (19)$$

$$\frac{2.5}{19} = M_2$$

$$M_2 = 0.1315\text{M}$$

**SOCH BADLO BY MAK**

Contact WhatsApp Number: +92 331 5014353

Q2). Draw pH titration curve when  $20\text{cm}^3$  of HCl from burette is added to  $20\text{cm}^3$  of aqueous solution of  $\text{NH}_3$  present in conical flask.

**Given:** Strong acid in burette (HCl) and Weak base in conical flask ( $\text{NH}_3$ )

**pH titration curve when HCl is added to  $\text{NH}_3$  ( $20\text{cm}^3$ ):**

- 'Equivalence point' will be **5.5 pH**
- 'Initial pH' will be between **1- 2 pH**
- 'Final pH' will be between **10 - 12 pH**

### 1. Multiple Choice Questions (MCQs)

- The value of the ionic product of water
  - a) depends on volume of water
  - b) depends on temperature
  - c) changes by adding acid or alkali
  - d) always remains constant
- A base when dissolved in water yields a solution with a hydroxyl ion concentration of  $0.05\text{ mol dm}^{-3}$ . The solution is
  - a) Basic
  - b) Acidic
  - c) Neutral
  - d) either b or c

- iii. pH scale was introduced by.  
 a) Arrhenius  
 b) Sorensen  
 c) Lewis  
 d) Lowry
- iv. pH of solution is defined by expression  
 a)  $\log[H^+]$   
 b)  $\log\left[\frac{1}{H^+}\right]$   
 c)  $\frac{1}{\log[H^+]}$   
 d)  $\frac{1}{-\log[H^+]}$
- v. The pH of a  $10^{-3}$  M HCl solution at  $25^\circ\text{C}$  if it is diluted 1000 times, will be  
 a) 3  
 b) zero  
 c) 5.98  
 d) 6.02
- vi. How many  $\text{dm}^3$  of water must be added to 1  $\text{dm}^3$  an aqueous solution of HCl with a pH of 1 to create an aqueous solution with pH of 2?  
 a) 0.1  $\text{dm}^3$   
 b) 0.9  $\text{dm}^3$   
 c) 2.0  $\text{dm}^3$   
 d) 9.0  $\text{dm}^3$
- vii. What is the approximate pH of a  $1 \times 10^{-3}$  M NaOH solution?  
 a) 3  
 b) 11  
 c) 7  
 d)  $1 \times 10^{-11}$
- viii. Calculate the pOH of a solution at  $25^\circ\text{C}$  that contains  $1 \times 10^{-10}$  M of hydronium ions, i.e.  $\text{H}_3\text{O}^+$   
 a) 4.0  
 b) 9.0  
 c) 1.0  
 d) 7.0
- ix. The pH value of a 10 M solution of HCl is  
 a) less than 0  
 b) equal to 0  
 c) equal to 1  
 d) equal to 2
- x. Which of the following has the highest pH?  
 a)  $\frac{M}{4}$  KOH  
 b)  $\frac{M}{4}$  NaOH  
 c)  $\frac{M}{4}$   $\text{NH}_4\text{OH}$   
 d)  $\frac{M}{4}$   $\text{Ca}(\text{OH})_2$
- xi. Which of the following statements are correct?  
 (i)  $K_w = [\text{H}^+][\text{OH}^-] = 10^{-14} \text{ mol}^2\text{dm}^{-4}$  at  $298\text{K}$   
 (ii) At  $298\text{K}$   $[\text{H}^+] = [\text{OH}^-] = 10^{-7}$   
 (iii)  $K_w$  does not depend upon temperature  
 (iv) Molarity of pure water = 55.55 M  
 a) (i), (ii) and (iii)  
 b) (i), (ii) and (iv)  
 c) (i) and (iv)  
 d) (ii) and (iii)

### EXERCISE SHORT ANSWER QUESTIONS.

Q1). Calculate  $H^+$  ion concentration of a solution prepared by dissolving 4g of NaOH (Atomic weight of Na = 23 amu) in  $1000\text{ cm}^3$  of solution?

**Data :**

Mass of NaOH = 4g

Molar Mass of NaOH = 40 g/mol

Volume =  $1000\text{ cm}^3 = 1\text{ dm}^3$

**Required :**  $[H^+]$

**Solution :** According to formula:

$$\text{Moles} = \frac{\text{mass}}{\text{molar mass}}$$

$$\text{Moles} = \frac{4}{40}$$

$$\text{Moles} = 0.1\text{ mol}$$

Now,

$$pOH = -\log [OH^-]$$

$$pOH = -\log (0.1)$$

$$pOH = 1$$

$$\therefore pH + pOH = 14$$

$$pH = 14 - pOH$$

$$pH = 14 - 1$$

$$pH = 13$$

Now to find  $[H^+]$  : As we know,

$$pH = -\log [H^+]$$

$$13 = -\log [H^+]$$

$$-13 \text{ (antilog)} = [H^+]$$

$$[H^+] = 1 \times 10^{-13}\text{ M}$$

GET ADMISSION IN OUR ONLINE INSTITUTE

**SOCH BADLO BY MAK**

Contact WhatsApp Number: +92 331 5014353

**Q2). Calculate the pH of 0.005 molar solution of  $\text{H}_2\text{SO}_4$ .**

**Data :**  $[\text{H}^+] = 0.005 \text{ M}$

**Required :**  $\text{pH} = ?$

**Solution :** According to formula.

$$\text{pH} = -\log [\text{H}^+]$$

$$\text{pH} = -\log [0.005]$$

$$\text{pH} = 2.30$$

**Q3). Calculate the pH of the following compounds :**

**(i)  $10^{-4} \text{ M KOH}$**

**Sol).**  $\text{pOH} = -\log [\text{OH}^-]$

$$\text{pOH} = -\log (10^{-4})$$

$$\text{pOH} = 4$$

Now to find pH,

$$\text{pH} + \text{pOH} = 14$$

$$\text{pH} = 14 - \text{pOH}$$

$$\text{pH} = 14 - 4$$

$$\text{pH} = 10$$

**(ii)  $10^{-10} \text{ M HCl}$**

**Sol).**  $\text{pH} = -\log [\text{H}^+]$

$$\text{pH} = -\log (10^{-10})$$

$$\text{pH} = 10$$

**(iii)  $10^{-10} \text{ M KOH}$**

**Sol).**  $\text{pOH} = -\log [\text{OH}^-]$

$$\text{pOH} = -\log (10^{-10})$$

$$\text{pOH} = 10$$

Now to find pH,

$$\text{pH} + \text{pOH} = 14$$

$$\text{pH} = 14 - \text{pOH}$$

$$\text{pH} = 14 - 10$$

$$\text{pH} = 4$$

**(iv)  $10^{-4} \text{ M HCl}$**

**Sol).**  $\text{pH} = -\log [\text{H}^+]$

$$\text{pH} = -\log (10^{-4})$$

$$\text{pH} = 4$$

**Q4).  $100\text{cm}^3$  of  $0.04 \text{ M HCl}$  aqueous solution is mixed with  $100\text{cm}^3$  of  $0.02\text{M NaOH}$  solution. Calculate the pH of the resulting solution.**

**Data :** Volume of  $\text{HCl} = V_1 = 100 \text{ cm}^3 = 0.100 \text{ L}$

Molarity of  $\text{HCl} = M_1 = 0.04 \text{ M}$

Volume of  $\text{NaOH} = V_2 = 100 \text{ cm}^3 = 0.100 \text{ L}$ ,

Molarity of  $\text{NaOH} = M_2 = 0.02 \text{ M}$

GET ADMISSION IN OUR ONLINE INSTITUTE

**SOCH BADLO BY MAK**

Contact WhatsApp Number: +92 331 5014353

**Required:** pH of resulting solution

As we know,

$$M_1V_1 = (0.04)(0.1) = 0.004$$

$$M_2V_2 = (0.02)(0.1) = 0.002$$

$$\text{Excess HCl} = 0.004 - 0.002 = 0.002 \text{ mol}$$

$$\text{Total volume} = 0.1 + 0.1 = 0.2 \text{ L}$$

$$[\text{H}^+] = \frac{\text{excess moles}}{\text{total volume}}$$

$$[\text{H}^+] = \frac{0.002}{0.2}$$

$$[\text{H}^+] = 0.01 \text{ M}$$

According to pH formula :

$$\text{pH} = -\log [\text{H}^+]$$

$$\text{pH} = -\log (0.01)$$

$$\text{pH} = 2$$

**Q5). Equal volume of three acid solutions of pH 3, 4, and 5 are mixed in a vessel. What will be the  $\text{H}^+$  ion concentration in the mixture?**

**Data :** pH = 3,4,5

**Required:**  $[\text{H}^+] = ?$

**Solution :** According to formula

$$\text{pH} = -\log [\text{H}^+]$$

Put pH = 3

$$-3 (\text{antilog}) = [\text{H}^+]$$

$$[\text{H}^+] = 0.001 \text{ M}$$

Put pH = 4

$$-4 (\text{antilog}) = [\text{H}^+]$$

$$[\text{H}^+] = 0.0001 \text{ M}$$

**SOCH BADLO BY MAK**

Contact WhatsApp Number: +92 331 5014353

Put  $\text{pH} = 5$                        $-5$  (antilog) =  $[\text{H}^+]$   
 $[\text{H}^+] = 0.00001 \text{ M}$

Taking average,

$$[\text{H}^+] = \frac{0.001 + 0.0001 + 0.00001}{3}$$

$$[\text{H}^+] = \frac{0.00111}{3}$$

$$[\text{H}^+] = 3.7 \times 10^{-4}$$

**Q6). A  $20 \text{ cm}^3$  sample of  $0.2 \text{ mol dm}^{-3} \text{ NH}_{3(\text{aq})}$  was titrated with  $0.1 \text{ mol dm}^{-3} \text{ HCl}$ . On the following axes sketch how the pH changes during this titration. Mark clearly where the end point occurs.**

**Ans).  $\text{NH}_3 + \text{HCl} \rightarrow \text{NH}_4\text{Cl}$**

**Data :**  $M_1 = \text{NH}_3 = 0.2$

$V_1 = \text{NH}_3 = 20 \text{ cm}^3$

$M_2 = \text{HCl} = 0.1$

$V_2 = \text{HCl} = ?$

According to formula,

$$M_1 V_1 = M_2 V_2 \quad (\text{for } 1:1 \text{ reaction})$$

By putting values,

$$(0.2)(20) = (0.1)V_2$$

$$4 = V_2 (0.1)$$

$$\frac{4}{0.1} = V_2$$

$$V_2 = 40 \text{ cm}^3$$

- So, the volume of added titrant will be  $40 \text{ cm}^3$ .
- At Burette strong acid  $\text{HCl}$  (titrant) is taken
- At Conical flask weak base  $\text{NH}_3$  (analyte) is taken.

pH titration curve for strong acid(HCl) added to weak base( $\text{NH}_3$ )  $40\text{cm}^3$ :

- Equivalence point will be 5.5 pH
- Initial pH will be between 1-2.
- Final pH will be between 10-12.

### SLO BASED QUESTIONS:

**Q1). Prove that  $\text{pH} + \text{pOH} = 14$  at  $25^\circ\text{C}$ .**

**Sol).** Ionization constant of water:

$$[\text{H}^+][\text{OH}^-] = K_w \quad \therefore K_w = 10^{-14}$$

$$[\text{H}^+][\text{OH}^-] = 10^{-14}$$

Taking log on both sides:

$$\log[\text{H}^+][\text{OH}^-] = \log 10^{-14}$$

$$\therefore \log a.b = \log a + \log b$$

$$\log[\text{H}^+] + \log[\text{OH}^-] = -14 \log 10$$

$$\therefore \log x^n = n \log x$$

$$\log[\text{H}^+] + \log[\text{OH}^-] = -14 \times 1$$

$$\therefore \log 10 = 1$$

$$\log[\text{H}^+] + \log[\text{OH}^-] = -14$$

Multiplying both sides with  $-1$

$$(-\log[\text{H}^+]) + (-\log[\text{OH}^-]) = -(-14) \quad \therefore \text{pH} = -\log[\text{H}^+] \text{ and } \text{pOH} = -$$

$$\log[\text{OH}^-]$$

$$\text{pH} + \text{pOH} = 14$$

**Hence proved.**

**Q2). Prove that  $\text{pK}_a + \text{pK}_b = 14$ .**

**Sol).** As we know,

$$K_a \times K_b = K_w \quad \therefore K_w = 10^{-14}$$

$$K_a \times K_b = 10^{-14}$$

Taking log on both sides:

$$\log K_a \times K_b = \log 10^{-14}$$

$$\therefore \log a \times b = \log a + \log b$$

$$\log K_a + \log K_b = -14 \log 10$$

$$\log K_a + \log K_b = -14$$

Multiplying both sides with  $-1$ .

$$(-\log K_a) + (-\log K_b) = -(-14) \quad \therefore \text{pK}_a = -\log K_a \text{ and } \text{pK}_b = -\log K_b$$

$$\text{pK}_a + \text{pK}_b = 14$$

**Hence proved.**

**Q3). Prove that  $pK_a + pK_b = pK_w$ .**

**Sol).** As we know,

$$K_a \times K_b = K_w$$

Applying log on both sides,

$$\log K_a \times K_b = \log K_w$$

$$\because \log a \times b = \log a + \log b$$

$$\log K_a + \log K_b = \log K_w$$

Multiplying both sides by -1,

$$(-\log K_a) + (-\log K_b) = -\log K_w$$

$$\because pK_a = -\log K_a, \quad pK_b = -\log K_b, \quad pK_w = -\log K_w$$

$$pK_a + pK_b = pK_w$$

Hence proved.

**Q4). prove that  $K_a \propto \frac{1}{K_b}$**

**Sol).** Reaction for an acid:

$$K_a = \frac{[H^+][A^-]}{[HA]} \quad \text{————(i)}$$

Reaction of a base :

$$K_c = \frac{[HA][OH^-]}{[A^-][H_2O]}$$

$$K_c[H_2O] = \frac{[HA][OH^-]}{[A^-]} \quad \text{————(ii)}$$

Multiplying equation (i) and (ii)

$$\because K_c[H_2O] = K_b$$

$$K_a \times K_b = \frac{[H^+][A^-]}{[HA]} \times \frac{[HA][OH^-]}{[A^-]}$$

$$K_a \times K_b = [H^+][OH^-]$$

$$\because K_w = [H^+][OH^-]$$

$$K_a \times K_b = K_w$$

$$K_a = \frac{K_w}{K_b}$$

$$\because K_w = \text{constant}$$

$$K_a \propto \frac{1}{K_b}$$

**Hence proved.**

**Q5). What is the purpose of pH titration curves?**

**Ans).** The steepest part of the curve shows where the acid and base have completely neutralized each other. This helps us know exactly how much titrant is needed.

Indicators change color at specific pH ranges.

By looking at the pH at the equivalence point on the curve, we can choose the best indicator.

Curve shape tells us if the acid/base is strong or weak.

→ Strong acid + strong base: sharp vertical jump at pH 7

→ Weak acid + strong base: gradual rise, equivalence point > 7

→ Strong acid + weak base: equivalence point < 7

In weak acid/base titrations, curves show buffer zones where pH changes very slowly.

**Q6). Phenolphthalein is pink in alkaline solution and colourless in acidic solution. During a titration, the conical flask contains a neutralised solution at the end point. Why does the phenolphthalein indicator become colourless instead of remaining pink?**

**Ans).** At the end point, the solution in the conical flask is only just neutralised. This means there is no excess alkali present to maintain the pink colour of phenolphthalein. Since phenolphthalein is colourless in acidic and neutral solutions, its colour disappears when the last drop of acid neutralises the base.

**Q7). Differentiate between End point and Equivalence point.**

**Difference :**

 Contact WhatsApp Number: +92 331 5014353

End point	Equivalence point
" <b>The end point</b> is the stage where the <b>indicator changes colour</b> , usually when there is a slight <b>excess of OH<sup>-</sup> ions</b> (so the pH jumps just <b>above 7</b> , into the <b>basic range</b> )."	" <b>The equivalence point</b> is the stage on the titration curve <b>where the acid and base have completely neutralised each other.</b> "
On the pH titration curve, the end point <b>corresponds to the point where the chosen indicator undergoes its colour change.</b>	On the pH titration curve, <b>the equivalence point corresponds to the sharp inflection.</b>
The end point is the <b>final observed pH of the solution, detected by the indicator's colour change.</b>	The pH at the equivalence point <b>depends on the type of acid-base titration: <math>\approx 7</math> (strong acid + strong base), <math>&gt; 7</math> (weak acid + strong base), <math>&lt; 7</math> (strong acid + weak base).</b>
The end point is a value that <b>indicates neutralisation is achieved to a visible level.</b>	The equivalence point is the <b>true chemical neutralisation point where the moles of H<sup>+</sup> = moles of OH<sup>-</sup>.</b>

**Q8). What is the use of a pipette?**

**Ans).** A pipette is used to accurately measure and transfer a fixed volume of a liquid, usually the solution of known concentration, into the conical flask during a titration. It ensures precision and reliability in quantitative analysis.

**Q9). Why is an indicator used?**

**Ans).** An indicator is used in titration to show the point at which neutralisation has occurred. Since acids and bases are colourless in dilute solutions, an indicator helps to visually detect the end point by changing colour, ensuring accuracy in determining the unknown concentration.

**Q10). What is the use of a burette and conical flask?**

**Ans). Burette :** "A burette is used to deliver a measured volume of the solution of known concentration (the titrant) into the conical flask. It allows controlled addition, drop by drop, until the end point is reached."

**Conical flask :** "A conical flask is used to contain a fixed volume of the solution of unknown concentration (the analyte). The solution from the burette reacts with the analyte until neutralisation is achieved."

**Q11). Explain why the product of  $[H^+]$  and  $[OH^-]$  is always constant at a given temperature.**

**Ans).** The product of  $[H^+]$  and  $[OH^-]$  is always constant at a given temperature because the self-ionisation of water is an equilibrium process. At constant temperature, the equilibrium constant ( $K_w$ ) remains fixed, so  $[H^+][OH^-] = K_w$ .

**Q12). Why does  $K_w$  increase with temperature?**

**Ans).** The dissociation of water is an endothermic process, so increasing temperature shifts equilibrium towards more ionisation, hence  $K_w$  increases.

**Q13). What is a neutralization point?**

**Ans).** "The neutralisation point is the stage in a titration at which an acid has completely reacted with a base (or vice versa) to form salt and water."

At the neutralisation point, the number of moles of  **$H^+$  ions =  $OH^-$  ions.**
